

“A College is a temple of wisdom, seed bed of character, model of discipline, training ground of democracy and a nursery of great hearts, strong mind, true faith and willing hands. Hence, education has a pivotal role in harvesting the available resources to contribute to the prosperity of the nation”

- Arutchelvar Dr. N. Mahalingam

Holistic Education for the wholesome development of Human personality for the overall well-being of the Humanity as a whole.

Dr. B. K. Krishnaraj Vanavarayar  
President

## ACADEMIC COUNCIL MEETING

EMPOWER THE YOUTH TO ENRICH THE NATION

11.11.2020

|                        |          |                             |                   |            |

| <b>Course Code:</b>    | 20PPS101 | <b>Title</b>                | <b>Batch:</b>     | 2020- 2022 |
|                        |          | Core I: Classical Mechanics | <b>Semester:</b>  | I          |
| <b>Hrs/Week:</b>       | 5        |                             | <b>Credits:</b>   | 4          |

### Course Objective

- To gain knowledge and understanding of Lagrangian and Hamiltonian formulations of mechanics and to apply them to simple systems.

### Course outcomes

|    |     |                                                                                                                   |
|----|-----|-------------------------------------------------------------------------------------------------------------------|
| K1 | CO1 | To understand the relation between symmetry operation and classical conservation laws                             |
| K2 | CO2 | To tackle the new problem and application techniques of classical mechanics to far-flung reaches of science       |
| K3 | CO3 | To get clear understanding of recent intricate theories of modern physics                                         |
| K4 | CO4 | To provide smooth transition from traditional techniques to rapidly growing area of non-linear dynamics and chaos |

### Syllabus

| Unit | Content                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Hrs |
|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| I    | <b>LAGRANGIAN FORMALISM</b><br>Constraints and Degrees of freedom - Generalized coordinates: Generalized Displacement, Velocity, Acceleration, Momentum, Force & Potential - Variational techniques and Euler's Lagrange differential equation - Hamilton's Variational principle - Lagrange's equation of motion from Hamilton's principle - Deduction of Newton's second law of motion from Hamilton's principle - Applications of Lagrange's equation of motion: Linear harmonic oscillator - Simple pendulum - Isotropic oscillator - Particle moving under central force - <i>Conservation theorems: Cyclic coordinates - Conservation of Linear momentum - Conservation of energy</i> | 13  |
| II   | <b>HAMILTONIAN FORMALISM</b><br>Phase space - Hamiltonian - Hamilton's canonical equation of motion - Significance of H - Deduction of canonical equation from Variational principle - Applications of Hamilton's equation of motion: Simple pendulum - Particle in a central field of force - Hamiltonian of a Charged particle in an electromagnetic field - Principle of least action and proof - Canonical transformations - Generating function and different forms - Poisson brackets: Definition - Equation of motion in Poisson bracket form - Angular momentum and Poisson bracket relations                                                                                       | 13  |
| III  | <b>HAMILTON JACOBI THEORY</b><br>Hamilton Jacobi method: H J partial differential equation - Solution of H J equation - Discussion on Hamilton's principle function - Solution of harmonic oscillator problem by H J method - Particle falling freely - H J equation for Hamilton's characteristic function - Kepler's problem solution by H J method - Action and Angle variables - Solution of harmonic oscillator problem by action angle variable method                                                                                                                                                                                                                                | 13  |
| IV   | <b>RIGID BODY DYNAMICS</b><br>Generalised co ordinates for rigid body motion – Euler's theorem – Euler's angles - Rotational kinetic energy of a rigid body - Equations of motion for a rigid body_ Euler's equations : Lagrange's method – Equation of motion about fixed axis - The motion of symmetric top under the action of gravity- Force free motion of symmetrical rigid body.                                                                                                                                                                                                                                                                                                     | 13  |

|                            |                                                                                                                                                                                                                                                                                                                                                        |    |

### Course Objective

- To apply knowledge of mathematical methods in the concepts of Physics

### Course outcomes

|    |     |                                                                                                      |
|----|-----|------------------------------------------------------------------------------------------------------|
| K1 | CO1 | To recollect the basic mathematical relations such as tensors, special functions, wave equations etc |
| K2 | CO2 | To apply the correct mathematical formulae to solve the expressions in physics                       |
| K3 | CO3 | To implement the functions and equations in the field of physics                                     |
| K4 | CO4 | To evaluate the problems in classical quantum and Electromagnetic field theory                       |

### Syllabus

| Unit | Content                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Hrs |
|------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| I    | <b>SPECIAL FUNCTIONS</b><br>Legendre differential equations and Legendre functions - Generating function of Legendre polynomial - Orthogonal properties of Legendre's polynomials - Recurrence formulae for $P_n(x)$ - Bessel's differential equations: Bessel's functions of first kind - To solve $J_{1/2}(x)$ , $J_{-1/2}(x)$ , $J_{3/2}(x)$ and $J_{-3/2}(x)$ - Recurrence formulae for $J_n(x)$ - Generating function of $J_n(x)$ - Hermite differential equation & Hermite polynomials - Generating function of Hermite polynomials - <i>Recurrence formulae for Hermite polynomials</i>                                                                            | 13  |
| II   | <b>COMPLEX VARIABLES</b><br>Analytic function: definition – The necessary and sufficient conditions for $f(z)$ to be analytic: Cauchy Riemann Differential equations in polar form – Cauchy's integral theorem(Cauchy proof only) - Cauchy's integral formula - Taylor's series and Laurent's series - Singularities of an analytic function - Residues and their evaluation - Cauchy Residue theorem - Evaluation of definite integrals of certain important real integrals.                                                                                                                                                                                             | 13  |
| III  | <b>LAPLACE &amp; WAVE EQUATIONS</b><br>Solution of Laplace's equation in Cartesian coordinates - Examples of Two dimensional steady flow of heat - Solution of Laplace's equation in two dimensional cylindrical coordinates – Problems - Solution of Laplace's equation in Spherical polar coordinates – Problems – Diffusion equation or Fourier equation of heat flow - Solution of heat flow equation –Variable linear flow-Problems.                                                                                                                                                                                                                                 | 13  |
| IV   | <b>FOURIER INTEGRAL AND TRANSFORMATIONS</b><br>Fourier Integral– Fourier's Transform: Infinite Fourier sine and cosine transforms - Properties of Fourier's Transform: Addition theorem, Similarity theorem, Shifting property, Modulation theorem- Convolution theorem and Parseval's theorem – Problems – Finite Fourier sine and cosine transforms - Problems – Simple application of Fourier transform: Evaluation of integrals.                                                                                                                                                                                                                                      | 13  |
| V    | <b>TENSORS, BETA AND GAMMA FUNCTIONS</b><br>n- dimensional space- Superscripts and Subscripts- Transformation of co-ordinates – Indicial convention-Summation convention – Dummy and real indices -Kronecker delta symbol -Generalised Kronecker delta - Scalars,contravariant and covariant vectors- Tensors of higher ranks - Algebraic operations of tensors – Quotient law - <i>Symmetric and skew symmetric tensors</i> - Beta and Gamma functions: Symmetry property of beta function – Evaluation of beta function – Transformation of beta function - Evaluation of Gamma function - Transformation of Gamma function – Relation between beta and gamma function. | 13  |

### Course Objective

- To understand the concepts of Statistical Mechanics and to apply these concepts to various physical phenomena.

### Course outcomes

|    |     |                                                                                                                                                                 |
|----|-----|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| K1 | CO1 | To understand the concept of statistical mechanics                                                                                                              |
| K2 | CO2 | To study the physical properties of a mechanical system in a situation when description is incomplete.                                                          |
| K3 | CO3 | To understand the average value of thermodynamic system and get clarity on equilibrium and non-equilibrium system                                               |
| K4 | CO4 | To explain the microscopic properties of a system on the basis of the dynamical behavior of its constituent particle and realization of atomic theory of matter |

|------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| I    | <b>CONCEPTS OF STATISTICAL MECHANICS</b><br>Phase space – Number of phase cells in given energy range of harmonic oscillator and three dimensional free particle - Volume in Phase space – Ensembles – Micro, Canonical ensemble – Canonical ensemble – Grand canonical – ensemble – Uses of ensemble – Liouville's theorem - Postulate of equal a priori probability – Statistical equilibrium – Thermal equilibrium - Mechanical equilibrium – Particle equilibrium – Thermo dynamical quantities : entropy – enthalpy – Helmholtz free energy – Gibb's free energy - Chemical potential - Connection between statistical and thermo dynamical quantities | 13  |
| II   | <b>CLASSICAL STATISTICS</b><br>Microstates and Macro states – Division of phase space into cells - Classical Maxwell Boltzmann distribution law – Most probable speed , Mean speed , Mean square speed , Root mean square speed - Principle of equipartition energy – Gibbs paradox – Partition function and its correlation with thermodynamic quantities. Partition function and their properties, effect of shifting zero level of energy on partition function, mean energy, specific heat, entropy -comparison of ensemble – Equipartition theorem from canonical distribution                                                                         | 13  |
| III  | <b>QUANTUM STATISTICS</b><br>Transition from classical statistical Mechanics to Quantum Statistical Mechanics – Indistinguishability in quantum statistics – Statistical weight or a priori probability – Matrices – The density matrix – Postulates – Condition for statistical equilibrium – Identical particles and symmetry requirement – Bose - Einstein distribution law – Fermi – Dirac distribution law - Maxwell Boltzmann statistics - Evaluation of Constant $\alpha$ & $\beta$ - Results of all three statistics.                                                                                                                               | 13  |
| IV   | <b>APPLICATION OF QUANTUM STATISTICS</b><br>Photon gas - Black body radiation and Planck radiation – Specific heat of solids – Einstein theory – Debye theory – Bose Einstein condensation – Liquid Helium - Electron Gas – Free electron model and electronic emission – Pauli's theory of                                                                                                                                                                                                                                                                                                                                                                 | 13  |

|                            |                                                                                                                                                                                                                                                                                                                                       |    |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----|
|                            | Para magnetism – <i>White dwarfs</i> .                                                                                                                                                                                                                                                                                                |    |
| V                          | <b>TRANSPORT PROPERTIES</b><br>Boltzmann transport equation – Thermal conductivity – Viscosity from Brownian movement – Onsager solutions – Fluctuations : Energy, Pressure volume, enthalpy – phase transition – First and second order phase transitions - Ising model – Bragg William approximation – One dimensional Ising model. | 13 |

### Course Objective

- To develop the basic knowledge about electromagnetic field and plasma physics

### Course outcomes

|    |     |                                                                                         |
|----|-----|-----------------------------------------------------------------------------------------|
| K1 | CO1 | To recollect the basic ideas about electric, magnetic fields and fourth state of matter |
| K2 | CO2 | To understand the applications of electromagnetic field and plasma physics              |
| K3 | CO3 | To analyze incompleteness of Ampere's law and completion of Maxwell's equation          |
| K4 | CO4 | Enhanced skill in solving problems by applying electromagnetic field expressions        |

### Syllabus

### Course Objective

- To understand the techniques of advanced physics experiments

### Course outcomes

|    |     |                                                                        |
|----|-----|------------------------------------------------------------------------|
| K3 | CO1 | To familiarize with the experimental techniques                        |
| K4 | CO2 | To get the idea about the experimental setup and arrangement of device |
| K5 | CO3 | To verify the experimental results with theoretical values             |

### List of experiments:

- Young's modulus - Elliptical fringes - Cornu's method
- Viscosity of a liquid - Mayor's oscillating disc
- Thermal conductivity - Forbe's method
- Temperature coefficient and band gap energy of a Thermistor
- Measurement of Spot size, Divergence & Wavelength of a Laser beam
- Young's modulus - Hyperbolic fringes - Cornu's method
- Specific heat of a liquid - Ferguson's method
- $\lambda$ ,  $d$  &  $\lambda$  Thickness of FP etalon – Fabryperot Interferometer
- Rydberg's constant - Helium spectrum
- Refractive index of a liquid & Absorption coefficient of transparent Material –Laser Source
- Rydberg's constant - Solar spectrum
- Hall effect in Semiconductors
- $e/m$  – Thomson's method
- Stefan's constant
- Biprism – Determination of  $\lambda$  of monochromatic source & thickness of a transparent sheet

### Course Objective

- To understand the working of semiconductor devices, amplifiers and oscillators.

### Course outcomes

|    |     |                                                                                        |
|----|-----|----------------------------------------------------------------------------------------|
| K3 | CO1 | Remember the applications of semiconductor devices                                     |
| K4 | CO2 | To get the idea and principles of electronics practically                              |
| K5 | CO3 | To access the action of electronic devices such as diode, transistor, UJT and FET etc. |

### List of experiments:

1. CRO - Familiarization: Lissajous figures, Measurement of Voltage, Phase and Frequency
2. I.C - Regulated power supply
3. RC coupled amplifier - Double stage
4. Feedback amplifier
5. FET amplifier - Common Source
6. Emitter follower
7. UJT - Characteristics
8. FET amplifier - Common Drain
9. Phase shift Oscillator using opamp
10. Power amplifier - Push Pull
11. SCR characteristics
12. Astable Multivibrator using 555 timer IC and Op amp
13. Power amplifier - Complementary symmetry
14. UJT - Relaxation Oscillator
15. Wave shaping circuits - Differentiator, Integrator, Clipper and Clamper

| <b>Hrs/Week:</b>       | 5        |                                | <b>Credits:</b>   | 4         |

### Course Objective

- To develop the skill to gain knowledge in Molecular Spectroscopy

### Course Outcomes

|    |     |                                                                                    |
|----|-----|------------------------------------------------------------------------------------|
| K1 | CO1 | To recollect Symmetry operations and learn about Group theory                      |
| K2 | CO2 | To understand the origin of Microwave, Raman and IR spectroscopy                   |
| K3 | CO3 | To deploy the conditions for resonance in NMR, ESR, NQR and Mossbauer Spectroscopy |
| K4 | CO4 | To review the theory and applications of NMR, ESR, NQR and Mossbauer Spectroscopy  |

### Syllabus

| Unit                       | Content                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Hrs |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| I                          | <b>MOLECULAR SYMMETRY &amp; GROUP THEORY</b><br>Group - Group Multiplication table - Classes - Symmetry elements and Symmetry operations –Symmetry planes and reflections - Inversion centre - Proper axes and proper rotations - Improper axes and improper rotations - Point groups - A systematic procedure for symmetry classification of molecules - Representations of a group - The Great Orthogonality theorem and its consequences - <i>Character tables</i>                                                                                                                                                                                                                                                                   | 13  |
| II                         | <b>MICROWAVE SPECTROSCOPY</b><br>Rotation of molecules – Rigid Diatomic molecule – Intensities of spectral lines - Effect of isotopic substitution –Non rigid rotator –Spectrum of non rigid rotator – Polyatomic molecules: Linear molecules - Symmetric top molecules - Techniques and Instrumentation.                                                                                                                                                                                                                                                                                                                                                                                                                               | 13  |
| III                        | <b>IR SPECTROSCOPY</b><br>Vibrating diatomic molecule: Energy of a diatomic molecule – Simple harmonic oscillator - Diatomic Vibrating Rotator - Vibrations of Polyatomic molecules: Fundamental vibrations and their symmetry – Overtone and combination of frequencies - Fourier transform IR spectroscopy<br><b>RAMAN SPECTROSCOPY</b><br>Quantum theory of Raman Effect - Classical theory of Raman effect: Molecular polarizability - Pure Rotational Raman spectra: Linear molecules – Symmetric top molecules - Vibrational Raman spectra: Raman activity of vibrations- Rule of Mutual Exclusion – Overtone and combination of vibrations - Structure determination from Raman & IR spectroscopy - Techniques & Instrumentation | 13  |
| IV                         | <b>RESONANCE SPECTROSCOPY</b><br>Magnetic properties of Nuclei - Resonance condition - Bloch equations and their Steady State solutions - Chemical shift – NMR instrumentation - Applications: NMR imaging - <i>Concept and theory of Electron Spin Resonance</i> – ESR spectrometer                                                                                                                                                                                                                                                                                                                                                                                                                                                    | 13  |
| V                          | <b>NQR, MOSSBAUER AND ELECTRONIC SPECTROSCOPY</b><br>Quadruple nucleus – Principle of NQR – Transitions for axially and non axially symmetric systems: Frequencies of transitions – Half Integral Spins – Integral Spins – NQR Instrumentation – Regenerative continuous wave oscillator method - Applications: Chemical bonding -Halogen quadrupole resonance - Principle and theory of Mossbauer Effect - Mossbauer instrumentation - Applications - Electronic spectroscopy - Vibrational coarse structure of electronic spectra - Frank Condon principle - Fortrat parabole                                                                                                                                                         | 13  |

### Course Objective

- To provide coherent perspective of the physical concepts and theories related with the characterization of materials

### Course outcomes

|    |     |                                                                                                          |
|----|-----|----------------------------------------------------------------------------------------------------------|
| K1 | CO1 | Provide an in-depth knowledge of structure of crystals                                                   |
| K2 | CO2 | Analyze the different properties like electric, magnetic and thermal and develop the skills for research |
| K3 | CO3 | Acquire deep understanding in the field of material science                                              |
| K4 | CO4 | To emphasize the applications of superconductors in industry and medical fields                          |

### Syllabus

### Course Objective

- To study the nuclear structure and properties of nuclei through nuclear models.

### Course outcomes

|    |     |                                                                                                          |
|----|-----|----------------------------------------------------------------------------------------------------------|
| K1 | CO1 | Understand the basic properties and structure of nucleus and nuclear reactions                           |
| K2 | CO2 | Analyze the properties and significance of stable nucleus through different types of nuclear models      |
| K3 | CO3 | Elucidate the latest development in the classification of elementary particles like quarks, Higgs bosons |
| K4 | CO4 | Develop skills in solving problems in nuclear physics and pave a way to research in nuclear physics      |

### Syllabus

| Unit | Content                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Hrs |
|------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| I    | <b>TWO BODY PROBLEM AND NUCLEAR FORCES</b><br>Deuteron - Properties - Ground state of Deuteron –Deuteron Problem- Neutron Proton scattering at low energies - Scattering length and effective range - Spin dependence of n p forces - Tensor forces –Interpretation of high energy nucleon – nucleon scattering - Exchange forces - Nuclear forces - Properties of nuclear forces - Yukawa theory of nuclear forces                                                              | 13  |
| II   | <b>NUCLEAR MODELS</b><br>Liquid drop model - Weizacker semi empirical mass formula - Shell model - Magic numbers - Magnetic moments and the Shell model - Prediction of angular momenta of nuclear ground states by Shell model - Collective model - Vibrational and Rotational states - <i>Elementary ideas of Unified and Superconductivity model</i>                                                                                                                          | 13  |
| III  | <b>NUCLEAR DISINTEGRATION</b><br>Law of radioactive decay - Alpha ray emission - Gamow's theory of alpha decay - Alpha ray energies and fine structure - Alpha disintegration energy - Beta decay - Fermi's theory of beta decay - Fermi and G.T Selection rules - Parity in beta decay - Helicity - Electron capture - Gamma decay - Theory of angular correlation of successive radiation - Internal conversion - Angular momentum and Parity of excited levels                | 13  |
| IV   | <b>NUCLEAR FISSION AND FUSION REACTORS</b><br>Fission and Nuclear structure - Bohr Wheeler's theory – Classification of neutrons according to energy-energetics of fission –Controlled fission reactions – four factor formula - Fission reactors - Radioactive fission products - A natural fission reactor - Basic fusion processes - Characteristics of fusion - Solar fusion - Controlled fusion reactors – Nuclear reactions: Compound nuclear reactions – direct reactions | 13  |
| V    | <b>ELEMENTARY PARTICLES</b><br>Fundamental forces in nature –positron and other antiparticles – meson and beginning of particle physics-General classification of Elementary particles - Conservation law – strange particle and strangeness – production of elementary particles and measurement of particle                                                                                                                                                                    | 13  |

|                            |                                                                                                                                                                                                                                                                                                                                                                                                       |    |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----|
|                            | properties – Eight fold way – CPT invariance - Gellmann Okuba mass formula for Baryons – Quark : Original quark model, charm and other developments – Colored Quarks (Quantum Chromodynamics ) – Experimental evidence for quarks- Explanation of nuclear force in term of quarks – Electroweak theory and standard model – Grand unification theory and super symmetry – String theory – Higgs boson |    |
| <b>Total contact hours</b> |                                                                                                                                                                                                                                                                                                                                                                                                       | 65 |

#### Course objective

- To become familiar with the techniques of advanced General Experiments.

#### Course outcomes

|    |     |                                                                               |
|----|-----|-------------------------------------------------------------------------------|
| K3 | CO1 | Become familiar with techniques of advanced general experiments               |
| K4 | CO2 | Impart the broad knowledge of experimental methods and measurement techniques |
| K5 | CO3 | Familiarize analytical calculations                                           |

#### List of Experiments:

- Copper Arc Spectra – CDS
- $\lambda_c$ ,  $d\lambda$  of a Monochromatic source - Michelson's Interferometer
- Zeeman Effect
- Magnetic Susceptibility - Quincke's Method
- Resistance of a Semiconductor – Four Probe Method
- Iron Arc Spectra – CDS
- Velocity of Sound in liquid- Ultrasonic Diffraction
- Magnetic Susceptibility- Guoy's Method
- Magnetoresistance
- BH Curve – Hysteresis - Standard Solenoid
- Brass Arc Spectra - CDS
- $e/m$  - Millikan's oil drop method
- Polarimeter - Specific rotation of optically active substances
- Determination of Planck's constant and verification of inverse square law
- Optical Fiber – Numerical aperture, Attenuation, Particle size and  $\lambda$

#### Course Objective

- To know the action and applications of operational amplifier, and to become familiarize with 8085 microprocessor

#### Course outcomes

|    |     |                                                                                         |
|----|-----|-----------------------------------------------------------------------------------------|
| K3 | CO1 | Gain knowledge and understanding of the components and equipments                       |
| K4 | CO2 | Design analog circuits, make measurements, analyze and interpret the experimental data. |
| K5 | CO3 | Use the 8085 microprocessor for interfacing devices.                                    |

#### List of Experiments:

- Parameters of Operational amplifier
- Inverting, Non Inverting, Differential amplifier - Op Amp
- Schmitt trigger, Scale changer, Phase changer - Op Amp
- Constant current source - Op Amp
- Microprocessor - Addition, Subtraction, Multiplication, Division & Conversion of Number systems
- Simple and Regenerative Comparators – Op Amp
- Digital to Analog converter - Op Amp
- Adder, Subtractor, Integrator and Differentiator- Op Amp
- Low pass, Band pass & High pass filters - Op Amp
- Microprocessor - Interfacing I
- Window Detector – Op Amp
- Analog to Digital converter - Op Amp
- Solving first order simultaneous equations of two variables- Op Amp
- Function Generator - Op Amp
- Microprocessor - Interfacing II

### Course Objective

- To acquire basic knowledge in object oriented programming

### Course outcomes

|    |     |                                                         |
|----|-----|---------------------------------------------------------|
| K3 | CO1 | To understand the concepts and benefits of OOPs         |
| K4 | CO2 | To analyze the functions of various C++ operators       |
| K5 | CO3 | To apply the C++ language to solve problems in Physics. |

### List of Experiments:

- Class implementation.
- Arrays within a Class.
- Static data members and member function.
- Arrays of Objects
- A function friendly to two classes.
- Simple constructor.
- Overloaded Constructors.
- Implementation of Destructors.
- Overloading Unary operator.
- Overloading Binary operator using member and friend function.
- Multiple inheritance.
- Multilevel inheritance.
- Virtual base class.
- Pointers to derived objects.
- Virtual functions.
